Description

Step 1:

- print the image as it is (NOT a mirror image) on coating paper
- print on the glossy side
 - paper properties: label paper (175g or above)
 - paper loading: manual (multi-purpose tray)
 - colour options: print in black and white

Step 2:

- place the metallic film on top of the printout with the grey side of the film facing down
- glue the top of edge of the film so that the film doesn't move inside the machine
- feed the overlapping papers through the pre-heated laminating machine twice (1st time to adhere to surface, 2nd time to achieve full transfer)
 - laminating temperature: 85C, speed: lowest possible
 - we recommend a laminating machine with 6 rollers that can also control temperature and speed

Step 3:

- carefully separate the film from the decal

Step 4:

- place the blue paper on top of the glossy side of the white coating paper with the metallic side of the blue paper facing down
- feed the papers through the pre-heated laminating machine
- laminating conditions same as above

Step 5:

- dab the blue decal with water and wait 40-50 secs. once the paper starts to separate, slowly slide to remove

Step 6:

- cut out the image

Step 7:

- place the cut out image in a bowl of water for 3-5 seconds. Take out the wet decal and leave it for 30-60 seconds
- use warm water in winter as cold water could compromise adhesion

Step 8:

- apply glue W1 on the surface of interest with a brush

Step 9:

- mount the wet decal face down and press firmly to ensure adherence
- gently peel off the backing paper

Step 10:

- once the decal is in the right spot, spread evenly and remove the wrinkles
- dab out the excess moisture

Step 11:

- hair dryer
 - heat for 2-3 mins, start at low heat then switch to high heat
 - if any air bubbles form, press to release
- microwave
 - heat for 3-4 mins, one object at a time (e.g. mug)
- oven
 - heat for 10-20 mins in the preheated oven at 100C
 - if you wish to dry multiples at once, heat for more than 1hr

Step 12:

- once completely dry, peel off the final film with fingertips or a craft knife, be careful not to make scratches as the ink is still weak.
- clean off any remaining glue around the decal with tissues or cloth dabbed in alcohol. Ink does not dissolve in alcohol

Step 13:

- bake in the oven
 - at 120-150C for more than 30 mins
 - at 180-220C for more than 10 mins
 - if you are putting in more than one project, bake longer

WASHING:

- hand-wash the product using a soft sponge
- do not place in hot water for too long as this could weaken the ink
- do not use inflammable thinner, alcohol or acetone to wash the product
